The Use and Impact of AI

Member comments regarding the use and impact of AI on departments, organizations, and our industry:

AI is the future. Regardless if you are using it or believe in it. It will change healthcare for the better when adoption becomes more prevalent.
AI will dramatically impact our front-line team by reducing repetitive tasks. AI must be implemented in conjunction with Finance to have the greatest impact. May require upskilling staff to understand and accept the change.
Do we have a standard definition of AI across AI? Having standard definitions and use cases would be helpful.
We are seeing more AI incorporated into medical devices.
We have deployed numerous RPA-based solutions within our supply chain but have not yet deployed any true AI solutions. When we deploy AI, I anticipate it will center on disruptions and demand planning.
We seem challenged (at our organization) to think organizationally instead of at the department or to address individual problems.
